

# Test LICR macros in LuaTeX's 8-bit compatibility mode

Günter Milde

2023/03/08

This document tests the compatibility of “luainputenc” and the Greek font setup for TU and PU. It uses only ASCII input.

See the source `test-inputenc.tex` for the input used in the examples.

## Contents

## 1 LICR input

The LaTeX internal character representation (LICR) is a verbose, fail-safe 7-bit ASCII encoding that can be used unaltered under both, 8-bit TeX (with any ASCII-compatible input encoding) and XeTeX/LuaTeX. Use cases are macro definitions and generated text.

### 1.1 Greek alphabet

Greek letters via LICR macros:

<code>A</code>	<code>B</code>	<code>Γ</code>	<code>Δ</code>	<code>E</code>	<code>Z</code>	<code>H</code>	<code>Θ</code>	<code>I</code>	<code>K</code>	<code>Λ</code>	<code>M</code>	<code>N</code>	<code>Ξ</code>	<code>O</code>	<code>Π</code>	<code>Ρ</code>	<code>Σ</code>	<code>T</code>	<code>Υ</code>	<code>Φ</code>	<code>X</code>	<code>Ψ</code>	<code>Ω</code>
<code>α</code>	<code>β</code>	<code>γ</code>	<code>δ</code>	<code>ε</code>	<code>ζ</code>	<code>η</code>	<code>θ</code>	<code>ι</code>	<code>κ</code>	<code>λ</code>	<code>μ</code>	<code>ν</code>	<code>ξ</code>	<code>ο</code>	<code>π</code>	<code>ρ</code>	<code>σ</code>	<code>τ</code>	<code>υ</code>	<code>φ</code>	<code>χ</code>	<code>ψ</code>	<code>ω</code>

The small sigma is set with a different glyph if it ends a word:

<code>σ</code>	<code>textsigma</code>
<code>ς</code>	<code>textfinalsigma</code> or <code>textvarsigma</code>

The `\textautosigma` macro (which automatically chooses the glyph according to the position) does not work with Unicode fonts (Xe/LuaTeX, font encoding TU).

### 1.2 Diacritics

Greek accents are tonos = oxia, varia, psili, dasia, dialytika, and perispomeni.

Greek diacritics can be input by named macro or symbol macro:

<code>ά</code>	<code>ά́</code>	<code>ά̀</code>	<code>ά̂</code>	<code>ί</code>	<code>ί̂</code>	<code>ί̃</code>	<code>ί̄</code>	<code>ί̇</code>	<code>ί̈</code>	<code>ί̉</code>	<code>ί̊</code>	<code>ί̋</code>	<code>ί̌</code>	<code>ί̍</code>	<code>ί̎</code>	<code>ί̏</code>	<code>ί̐</code>	<code>ί̑</code>	<code>ί̒</code>	<code>ί̓</code>	<code>ί̔</code>	<code>ί̕</code>	<code>ί̖</code>	<code>ί̗</code>	<code>ί̘</code>	<code>ί̙</code>
----------------	-----------------	-----------------	-----------------	----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------	-----------------

Combining diacritics were misplaced with the 2021 version of LuaTeX in 8-bit compatibility mode. This can be solved by selecting the "Harfbuzz" renderer (see the source).

<code>̂</code>	<code>̃</code>	<code>̄</code>	<code>̅</code>	<code>̆</code>	<code>̇</code>	<code>̈</code>	<code>̉</code>	<code>̊</code>	<code>̋</code>	<code>̌</code>	<code>̍</code>	<code>̎</code>	<code>̏</code>	<code>̐</code>	<code>̑</code>	<code>̒</code>	<code>̓</code>	<code>̔</code>	<code>̕</code>	<code>̖</code>	<code>̗</code>	<code>̘</code>	<code>̙</code>
----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------

Diacritics as spacing characters:

with empty argument:	<code>´</code> <code>̂</code> <code>̃</code> <code>̄</code> <code>̅</code> <code>̆</code> <code>̇</code> <code>̈</code> <code>̉</code> <code>̊</code> <code>̋</code> <code>̌</code> <code>̍</code> <code>̎</code> <code>̏</code> <code>̐</code> <code>̑</code> <code>̒</code> <code>̓</code> <code>̔</code> <code>̕</code> <code>̖</code> <code>̗</code> <code>̘</code> <code>̙</code>
with space as argument:	<code>´</code> <code>̂</code> <code>̃</code> <code>̄</code> <code>̅</code> <code>̆</code> <code>̇</code> <code>̈</code> <code>̉</code> <code>̊</code> <code>̋</code> <code>̌</code> <code>̍</code> <code>̎</code> <code>̏</code> <code>̐</code> <code>̑</code> <code>̒</code> <code>̓</code> <code>̔</code> <code>̕</code> <code>̖</code> <code>̗</code> <code>̘</code> <code>̙</code>
with protected space:	<code>´</code> <code>̂</code> <code>̃</code> <code>̄</code> <code>̅</code> <code>̆</code> <code>̇</code> <code>̈</code> <code>̉</code> <code>̊</code> <code>̋</code> <code>̌</code> <code>̍</code> <code>̎</code> <code>̏</code> <code>̐</code> <code>̑</code> <code>̒</code> <code>̓</code> <code>̔</code> <code>̕</code> <code>̖</code> <code>̗</code> <code>̘</code> <code>̙</code>
with nobreakspace:	<code>´</code> <code>̂</code> <code>̃</code> <code>̄</code> <code>̅</code> <code>̆</code> <code>̇</code> <code>̈</code> <code>̉</code> <code>̊</code> <code>̋</code> <code>̌</code> <code>̍</code> <code>̎</code> <code>̏</code> <code>̐</code> <code>̑</code> <code>̒</code> <code>̓</code> <code>̔</code> <code>̕</code> <code>̖</code> <code>̗</code> <code>̘</code> <code>̙</code>

#### 1.2.1 mute iota

The mute iota is input after the base letter.

- `\ypogegrammeni` following a Greek letter sets a sub-iota (corresponding to COMBINING GREEK YPOGEGRAMMENI), e.g.  $\alpha$ .

In Unicode, a GREEK CAPITAL LETTER ... followed by COMBINING GREEK YPOGEGRAMMENI is normalized to GREEK CAPITAL LETTER ... WITH [... AND] PROSGEGRAMMENI, if a corresponding letter exists in the Unicode standard. In LGR fonts, this is implemented via a ligature definition (set the Babel language or wrap in `\ensuregreek`):  $\text{Α}$  but  $\text{Λ}$ .

The shape and position of the mute iota with pre-composed capital letters depends on the selected font, both sub-iota and adscript iota are possible.

- `\prosgegrammeni` sets an adscript iota (GREEK PROSGEGRAMMENI), e.g.  $\text{A}\iota$ . In Unicode fonts the `prosgegrammeni` is spaced similar to the letter iota. In the CB Greek fonts, the only visible difference to the pre-composed characters is a slightly increased spacing.

Copy/Paste may convert the adscript iota to a small letter iota!

`Ypogegrammeni` and `prosgegrammeni` following matching/not-matching base character (unchanged, lowercase, uppercase):

```
 $\text{A}\iota\text{A}\iota$   $\alpha\alpha$   $\text{A}\iota\text{A}\iota$   
 $\text{\Lambda}\iota$   $\lambda\lambda$   $\text{\Lambda}\iota$   
 $\alpha\alpha$   $\alpha\alpha$   $\text{A}\iota\text{A}\iota$ 
```

Using `\ypogegrammeni` for the mute iota with both, small and capital letters usually gives better results.

### 1.3 Additional Greek symbols

#### 1.3.1 symbols for Greek numbers

```
 $\zeta$  textkoppa  
 $\text{\zeta}$  textKoppa  
 $\wp$  textqoppa (archaic koppa)  
 $\text{\wp}$  textQoppa (archaic Koppa)  
 $\varsigma$  textstigma  
 $\text{\varsigma}$  textStigma (Sigma-Tau-Ligature in CB-fonts)1  
 $\text{\textcircled{r}}$  textsampi  
 $\text{\textcircled{H}}$  textSampi  
 $\text{\textcircled{f}}$  textdigamma  
 $\text{\textcircled{F}}$  textDigamma  
 $\text{\textcircled{r}'}$  textdexiakeraia  
 $\text{\textcircled{,}}$  textaristerikeraia
```

#### 1.3.2 generic text symbols

LICR macros for some symbols from the 8-bit font encoding LGR that are not confined to Greek but not defined in `tuenc.def` [2018/08/11 v2.0j].

```
 $\text{\textcircled{;}}$  textsemicolon  
 $\mu$  textmicro  
 $\text{\textcircled{ə}}$  textschwa
```

The SI unit prefix MICRO SIGN is not upcased with `MakeUppercase`:

```
textmu:  $\mu \mapsto M$  but textmicro:  $\mu \mapsto \mu$ .
```

<sup>1</sup>the name “stigma” originally applied to a medieval sigma-tau ligature, whose shape was confusingly similar to the cursive digamma

text		mathematics	
macro	output	macro	output
